Hypothesis and cost function

$$H(x) = Wx + b$$

$$cost(W, b) = \frac{1}{m} \sum_{i=1}^m (H(x^{(i)}) - y^{(i)})^2$$

TensorFlow Mechanics

2 feed data and run graph (operation)
sess.run (op, feed_dict={x: x_data})

1 Build graph using
TensorFlow operations

3 update variables
in the graph
(and return values)

1

Build graph using TF operations

$$H(x) = Wx + b$$

```
# X and Y data
x_train = [1, 2, 3]
y_train = [1, 2, 3]

W = tf.Variable(tf.random_normal([1]), name='weight')
b = tf.Variable(tf.random_normal([1]), name='bias')
# Our hypothesis XW+b
hypothesis = x_train * W + b
```

$$cost(W, b) = \frac{1}{m} \sum_{i=1}^m (H(x^{(i)}) - y^{(i)})^2$$

```
# cost/loss function
cost = tf.reduce_mean(tf.square(hypothesis - y_train))
```

1

Build graph using TF operations

$$\text{cost}(W, b) = \frac{1}{m} \sum_{i=1}^m (H(x^{(i)}) - y^{(i)})^2$$

```
t = [1., 2., 3., 4.]  
tf.reduce_mean(t) ==> 2.5
```

```
# cost/loss function  
cost = tf.reduce_mean(tf.square(hypothesis - y_train))
```

GradientDescent

```
# Minimize  
optimizer = tf.train.GradientDescentOptimizer(learning_rate=0.01)  
train = optimizer.minimize(cost)
```

2
3

Run/update graph and get results

Launch the graph in a session.

```
sess = tf.Session()
```

Initializes global variables in the graph.

```
sess.run(tf.global_variables_initializer())
```

Fit the line

```
for step in range(2001):
```

```
    sess.run(train)
```

```
    if step % 20 == 0:
```

```
        print(step, sess.run(cost), sess.run(W), sess.run(b))
```

Full code (less than 20 lines)

```
import tensorflow as tf

# X and Y data
x_train = [1, 2, 3]
y_train = [1, 2, 3]

W = tf.Variable(tf.random_normal([1]), name='weight')
b = tf.Variable(tf.random_normal([1]), name='bias')

# Our hypothesis XW+b
hypothesis = x_train * W + b

# cost/loss function
cost = tf.reduce_mean(tf.square(hypothesis - y_train))

# Minimize
optimizer = tf.train.GradientDescentOptimizer(learning_rate=0.01)
train = optimizer.minimize(cost)

# Launch the graph in a session.
sess = tf.Session()

# Initializes global variables in the graph.
sess.run(tf.global_variables_initializer())

# Fit the line
for step in range(2001):
    sess.run(train)
    if step % 20 == 0:
        print(step, sess.run(cost), sess.run(W), sess.run(b))
```

```
...
0 2.82329 [ 2.12867713] [-0.85235667]
20 0.190351 [ 1.53392804] [-1.05059612]
40 0.151357 [ 1.45725465] [-1.02391243]
...

1920 1.77484e-05 [ 1.00489295] [-0.01112291]
1940 1.61197e-05 [ 1.00466311] [-0.01060018]
1960 1.46397e-05 [ 1.004444] [-0.01010205]
1980 1.32962e-05 [ 1.00423515] [-0.00962736]
2000 1.20761e-05 [ 1.00403607] [-0.00917497]
...
```

Placeholders

```
In [7]: a = tf.placeholder(tf.float32)
b = tf.placeholder(tf.float32)
adder_node = a + b # + provides a shortcut for tf.add(a, b)

print(sess.run(adder_node, feed_dict={a: 3, b: 4.5}))
print(sess.run(adder_node, feed_dict={a: [1,3], b: [2, 4]}))
```

7.5

[3. 7.]

Placeholders

X and Y data

```
x_train = [1, 2, 3]
```

```
y_train = [1, 2, 3]
```

Now we can use X and Y in place of x_data and y_data

placeholders for a tensor that will be always fed using feed_dict

See <http://stackoverflow.com/questions/36693740/>

```
X = tf.placeholder(tf.float32)
```

```
Y = tf.placeholder(tf.float32)
```

```
...
```

Fit the line

Fit the line

```
for step in range(2001):
```

```
    cost_val, W_val, b_val, _ = \
```

```
        sess.run([cost, W, b, train],
```

```
                feed_dict={X: [1, 2, 3], Y: [1, 2, 3]}))
```

```
if step % 20 == 0:
```

```
    print(step, cost_val, W_val, b_val)
```

Full code with placeholders

```
